

Northern Rhodesia 1963 6d missing value perforation variation

All sheets of the low values of the Northern Rhodesia 1963 set apart from the 1d and 3d values are normally found perforated through the bottom margin, and with the top margin without perforations, as shown here.

Curiously the only known sheet of the 6d with missing value is perforated the other way. As far as is known no other value including the other missing value errors is known with this variation. Possibly the variation is connected with the value being missing, but why only this value?
